IBM Cloud for VMware Solutions helps organizations improve productivity and efficiency, reduce IT overheads, and gain agility by offloading IT resources and management complexity to the cloud. Companies can accelerate hybrid cloud adoption by using VMware to enable easier, security-rich, and near-seamless extension of existing workloads, as they are, from on-premises data centers to powerful bare metal and virtual servers on IBM Cloud.

IBM Cloud for VMware Solutions Reference Architecture

Unlike many competitors, IBM Cloud provides full access to the native VMware stack to manage resources as you would on premises, and allows you to consume VMware software based on flexible, simple and predictable per CPU pricing. IBM Cloud for VMware can facilitate consistent management and governance of your hybrid environment with a common networking and security model. IBM Cloud’s 48 data centers around the world allow you to scale globally while still retaining complete and consistent control and automation of your operations on premises and in the cloud.
VMware Cloud Foundation

Go from months to minutes when you use VMware Cloud Foundation to implement and deploy a VMware environment. Using the advanced automation developed through the partnership between IBM and VMware, you can consistently deploy the unified software-defined VMware platform to the cloud. And you continue to use the same familiar tools and scripts to manage your workloads in the cloud without having to retool or refactor applications.

VMware vCenter Server

VMware vCenter Server on IBM Cloud provides the automated deployment of the underlying vSphere virtualization technology and vCenter Server management layer needed to build a flexible and customizable VMware solution that fits the client’s workloads.

IBM Cloud Infrastructure with VMware software

With VMware and IBM Cloud infrastructure, you can integrate, expand or migrate your on-premises workloads onto high-performance, global cloud resources. Easily extend your VMware footprint around the world on demand and control it all with the same VMware management control panel your team already uses.

Cloud Professional Services

The Cloud Professional Services team at IBM helps you to accelerate, design and implement VMware solutions on bare metal servers. This means you can more quickly create a seamless hybrid cloud environment and gain the ability to “lift and shift” or “lift and replicate” with no changes needed to the workloads/applications. The entire hybrid environment can then be managed as one. The IBM Cloud becomes an extension of your on-premises data centers.
